Note: 'Other' includes children going to madarsa and EGS. 'Not in school' = dropped out + never enrolled.

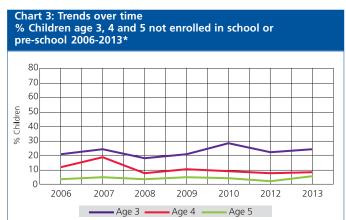

How to read this chart: Each line shows trends in the proportion of children out of school for a particular subset of children. For example, the proportion of girls (age 11-14) not in school was 8.6% in 2006, 6.6% in 2010, 5.6% in 2012 and is 5.7% in 2013.

How to read this table: If a child started school in Std I at age 6, she should be of age 8 in Std III. This table shows the age distribution for each class. For example, in Std III, 47.9% children are 8 years old but there are also 15.6% who are 7, 23% who are 9, 8.2% who are 10 and 3.4% who are older.

To interpret the chart alongside (Chart 4), several things need to be kept in mind:

The highest level in the ASER reading tool is the ability to read a Std II level text. ASER is a "floor" level test. All children (age 5 to 16) are assessed using the same tool; grade-level tools are not used in ASER.

We can see that the proportion of children who can read at least ${\sf Std}\ {\sf II}$ level text increases in successive standards. This is true for every year for which data is shown.

By Std VIII, when children have completed eight years of schooling, a high proportion of children are able to read the Std II level text. It is possible that many children in Std VIII are reading at higher levels, but ASER reading tests do not assess higher than Std II level.

This chart allows us to compare proportions of children reading at least Std II level texts in different standards across years. For example, see Std V in 2009, 2011 and 2013.

How to read this table: Each cell shows the highest level in arithmetic achieved by a child. For example, in Std III, 2.1% children cannot even recognize numbers 1-9, 8.6% can recognize numbers up to 9 but not more, 51.2% can recognize numbers up to 99 but cannot do subtraction, 32.9% can do subtraction but cannot do division, and 5.2% can do division. For each class, the total of all these exclusive categories is 100%.

^{*} This is the weighted average of govt. and pvt. schools only.

To interpret the chart alongside (Chart 5), several things need to be kept in mind:

The highest level in the ASER arithmetic tool is the ability to do a numerical division problem (dividing a three digit number by a one digit number). In most states in India, children are expected to do such computations by Std III or Std IV. ASER does not assess children using grade-level tools.

We can see that the proportion of children who can do this level of division increases in successive standards. This is true for every year for which data is shown.

By Std VIII, when children have completed eight years of schooling, a substantial proportion of children are able to do division problems at this level. It is possible that some children are able to do operations at higher levels too, but ASER arithmetic tests do not assess higher than this level.

This chart allows us to compare proportions of children who can do division in different standards across years. For example, see Std V in 2009, 2011 and 2013.

Type of school and paid additional tuition classes (tutoring)

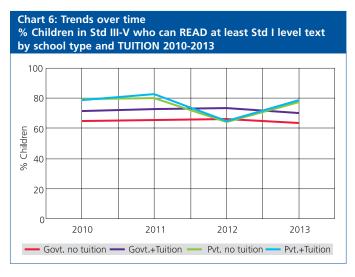

The ASER survey recorded information about paid additional private tutoring by asking the following question: "Does the child take any paid tuition class currently?" Therefore the numbers given below do not include any unpaid supplemental help in learning that the child may have received.
